CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention is directed to methods of detecting the presence  
of a bipolar mood disorder susceptibility locus in an individual,  
comprising analyzing a sample of DNA for the presence of a DNA  
polymorphism on the long arm of chromosome 18 between markers D18S469

and D18S554, wherein the DNA polymorphism is associated with a form of bipolar mood disorder. The invention for the first time provides strong evidence of a susceptibility gene for bipolar mood disorder that is located in the 18q22-q23 region of the long arm of chromosome 18. The disclosure describes the use of linkage analysis and genetic markers in this 18q22-q23 region to fine map the region and the use of genetic markers to genetically diagnose (genotype) bipolar mood disorder in individuals, to confirm phenotypic diagnoses of bipolar mood disorder, to determine appropriate treatments for patients with particular genotypic subtypes. Isolated polynucleotides useful for genetic linkage analysis of BP-I and methods for obtaining such isolated polynucleotides are also described.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB We are developing a full set of complementary software tools for silicon process simulation, including ion-implantation damage and diffusion. As a first step in this direction we have developed and tested an interface between Marlowe and MD which makes it possible to generate a high energy cascade, using Marlowe to a certain minimum cutoff energy ( $E_c$ ), and then feed a portion of that cascade into the MD simulator to carry on the simulation within the MD frame. In order to assess the results obtained using Marlowe linked to MD we have simulated 1 keV cascades using Marlowe with a cutoff energy  $E_c=200$  eV, followed by a 100 fs MD simulation, and compared the final configuration with that obtained using MD only. Binary collisions tend to over-estimate range and cascade volume. Since the difference arises in the low energy part of the trajectories the performance of the Marlowe-MD **linked simulation** greatly improves for higher  $E_c$  values.

AB Atlantic Resolve 94 was the first multinational, computer-linked simulation exercise. Computers were connected at various locations throughout Europe and the continental United States to control the venture. Actual troop maneuvers involved creating a combined joint task force to enhance allied command and control and land, sea and air force interoperability. Although not at the grand, strategic level of Atlantic Resolve 94, EW simulators are being used in almost every imaginable tactical situation. Simulator applications vary from research and development activities in the laboratory to system test and evaluation in anechoic chambers and test ranges to testing of installed systems in ground-based settings, on the flight line, in airborne situations or on board naval vessels. In addition, simulators are used in training activities and are essential in repair and upgrade activities. The author presents a survey of simulation basics and simulator categories.

AB Strategies to reduce motor vehicle travel by altering urban spatial structure are one piece of a comprehensive program to slow global warming.

While the connections between urban spatial form and urban travel have long been recognized, there have been few attempts in the United States to

model the interactions within the context of a public planning program in an urban region. One such effort, the Vision 2020 plan in the Seattle region, is described. The modeling tools utilized widely available travel and land-use models, applied interactively. A wide range of variables, transportation facility investments, demand management measures and land-use controls, were grouped into identifiable long-term alternatives. The analysis suggested some ambiguity in the ability to model the processes, particularly within a highly political planning program, and indicated rather modest effects of land-use changes on reducing urban travel over 20 to 30 years. Land use and demand management were most effective when supported by significant investment in facilities, including transit. Although attempting to alter urban spatial structure may not be the most cost-effective place to seek reductions in vehicular emissions over this period of time, planning programs like Seattle's may be an opportunity to mold less travel-dependent urban regions for the

next

century.
